

A WINDOW WELL LINER

ABSTRACT OF THE DISCLOSURE

A liner with a three dimensional pattern configured to secure to a window well. A mold is coated with a urethane release formula. Design colors are sprayed onto a pattern of the mold to reflect a natural rock appearance. Polyurethane is sprayed over the colors and onto the mold according to well known molding techniques and allowed to cure. The liner is removed and touched up for imperfections and coated with an ultraviolet coating to improve weatherability. A window well is measured and the liner is cut to match the window well dimensions. Screws fasten the liner to the window well. The screw heads are caulked and painted to match the appearance of the liner. A top cap may be applied to a top edge of the window well and liner.
